area and perimeter review. The Area & Perimeter of a Rectangle Paper. Two Area & Perimeter Propositions. A. The area and perimeter of a rectangle. Assume that the diagram above is a rectangle whose area and perimeter are given. Find the area and perimeter of the rectangle. The area and perimeter of a circle are defined as follows: • Area of the circle is πr^2 where r is the radius. • Perimeter of the circle is $2\pi r$. Area and perimeter of a circle. The area and perimeter of the circle are defined as follows: • Area of the circle is πr^2 where r is the radius. • Perimeter of the circle is $2\pi r$. Area and perimeter of a circle. How can we prove that the area and perimeter of a circle are equal? To find the area and perimeter of a circle, first we will find the area of a segment with an added segment. The following figure shows a circle with center at the origin $(0, 0)$ and a segment from the origin to point (a, b) . When finding the area of this segment, the units we use are cm. So the area we want to find is $9\pi a^2$. Next, we will find the length of arc 'A'. In order to find the length of arc 'A', we will use the formula: total arc length = 360 -angle subtended by the arc. In our case, the angle is the angle from the origin to point (a, b) . Let's find the angle. How do we find the angle? For finding the angle, first we will need the coordinates of point (a, b) . In our case, $a = 0$ cm and $b = 0.5$ cm. Next, we will need the coordinates of the origin $(0, 0)$. $a = 0$, $b = 0$, $c = 0$. So from what we learned, the coordinates of point (a, b) is $(0, 0.5)$, and the coordinates of the origin is $(0, 0)$. To find the coordinates of the origin, add them together and we will get $x=0$ and $y=0$. Now that we know the coordinates of point (a, b) and the origin, we can find the angle. Using what we know, angle is the angle subtended by the arc of the circle with coordinates (a, b) and the origin. Since we know the coordinates of the circle and the 82157476π
